

**Benefits and Damage Statement for the Redetermination of Benefits  
Benton County CD 12**

In accordance with Minnesota Statute (MS) 103E.351, we the viewers, submit the following Viewers' Report:

The fundamental principle for the determination of benefits and damages is based upon a comparison of the conditions prior to the construction of the ditch system with the conditions that exist after the implementation of the ditch system or proposed drainage project.

The undersigned viewers, pursuant to the order of the Benton County Drainage Authority, did meet prior to commencing duties on July 7th, 2020. Having taken the oath as required by MS 103E.305, did view, all lands affected by said proposed drainage system and further, we did determine the damages to lands affected by establishment of a grass strip, permanent and temporary damages.

We were able to determine the boundaries of the benefited area by processing and analyzing maps using "Light Detection and Ranging" (LiDAR) along with visually viewing the project area. Meetings were held with landowners, and Benton County staff. We viewed County Assessors' records to determine the number of acres of land in each parcel of each 40-acre tract of land. Other sources of information used were USDA-Natural Resources Conservation Service Web Soil Survey, 12 years of USDA satellite imagery, US Fish and Wildlife Service National Wetland Inventory (NWI) maps, and Benton County Assessors' sales data and annual report.

We have determined the extent and basis of benefits and damages as prescribed under MS 103E.315 and MS 103E.321. We have indicated in tabular form, for each lot, 40-acre tract, and fraction of a lot or tract under separate ownership that is benefited or damaged (see Exhibit A).

An easement, in the form of an additional restriction on the use of real property adjacent to the open channel of the drainage system, will be acquired and, therefore, damages will be awarded for the establishment of a permanent strip of perennial vegetation approved by the drainage authority that will not impede future maintenance of the drainage system as required in MS 103E.021. We determined these damages at two separate values. Grass Strip damages "A" acres, lands which current land use will not change, but will still have permanent restrictions of future land use. Grass Strip damages "B" acres, lands demanding a higher value based on current land use. The value determined for "A" acres is \$2277 and the value for "B" acres is \$4250.

Right of way damages, having been determined and paid in the original proceedings for establishment of the drainage system, based on the area contemplated and included in the

proceeding for the establishment or subsequent improvement of the drainage system, were not considered.

We have determined the following direct drainage benefits and indirect (outlet) benefits on and related to the redetermination of benefits for Benton County CD 12. Benefits were determined based on the drainage system operating in its as constructed condition.

#### Direct Benefits – Class 1 (Mapped as Red)

Using the direct market value approach, giving consideration for the lands' geographic location in the watershed, location relative to the outlet, proximity to the ditch bottom elevation, soil types, as well as analyzing direct sales data for competitive properties in the marketplace, we determined the existing market values of land in an unimproved condition as well as in an improved condition. Though this description may not describe your lands exactly, your lands fell broadly under this category.

Class 1 lands, prior to the existence of the drainage system, had a value range of \$759 to \$1139 per acre. They consisted mostly of lowlands that may have been farmed, but not without substantial risk. With the establishment of adequate drainage to these lands, the production value and/or market value has increased. These lands consist of soils that benefit greatly from good drainage. These lands are now more suitable for intense crop production.

The viewers have determined based on these values, along with allowances for private improvement costs, that Benton CD 12 provides for an increased market value/benefit to agricultural/cropland acres in Class 1 by the rate of \$1998 per acre.

#### Direct Benefits – Class 2 (Mapped as Yellow)

Using the direct market value approach, giving consideration for the lands' geographic location in the watershed, location relative to the outlet, proximity to the ditch bottom elevation, soil types, as well as analyzing direct sales data for competitive properties in the marketplace, we determined the existing market values of land in an unimproved condition as well as in an improved condition. Though this description may not describe your lands exactly, your lands fell broadly under this category.

Class 2 lands, prior to the existence of the drainage system, had a value range of \$2282 to \$2789 per acre. Although some row crops were grown in this land class, it was not without substantial risk of loss to the grower. Now that adequate drainage has been established through these lands, the production value and/or market value has increased. These lands typically consist of soils that benefit from good drainage to increase crop production.

The viewers have determined based on these values, along with allowances for private improvement costs, that Benton CD 12 provides for an increased market value/benefit to agricultural/cropland acres in Class 2 by the rate of \$1685 per acre.

### Direct Benefits – Class 3 (Mapped as Green)

Using the direct market value approach, giving consideration for the lands' geographic location in the watershed, location relative to the outlet, proximity to the ditch bottom elevation, soil types, as well as analyzing direct sales data for competitive properties in the marketplace, we determined the existing market values of land in an unimproved condition as well as in an improved condition. Though this description may not describe your lands exactly, your lands fell broadly under this category.

Class 3 lands, prior to the existence of the drainage system, had a value range of \$5981 to \$6835 per acre. These lands were mostly utilized for the production of row crops, although over saturation of the soil and surrounding lands did not allow for these lands to realize their full production potential. Now that the drainage system has been established, the land is able to utilize the system as an outlet to drainage tile systems and increased the production potential. As a result, the production value and/or market value has increased.

The viewers have determined based on these values, along with allowances for private improvement costs, that Benton CD 12 provides for an increased market value/benefit to agricultural/cropland acres in Class 3 by the rate of \$1286 per acre.

### Indirect Benefits – Class 4 (Mapped as Blue)

Class 4 lands are lands which have not had an increase in market value after the construction of the drainage system. However, they have been altered from their pre-settlement state in such a manner that they are now tilled and farmed. As a result, they burden the drainage system's capacity, thus increasing a sediment load and causing a need for increased maintenance. Taking into consideration the percentage of Class 4 acres in the watershed, regular ditch maintenance, and sediment loading, we determined the rate per acre that Benton CD 12 provides as an outlet or contribution benefit to these lands. Though this description may not describe your lands exactly, your lands fell broadly under this category. The viewers have determined the Class 4 outlet benefit rate to be \$386 per acre.

Example of how benefits were calculated:

Production and/or Market Value Before Project:	\$1,000
Production and/or Market Value After Project:	\$3,000
Increase in Production and/or Market Value:	\$2,000
Less Private Improvement Costs:	\$1,000
Net Benefits:	\$1,000

### Road Benefits

The viewers have determined outlet as well as reduced maintenance cost benefits for all State, County, and Township roads located within the boundary of Benton CD 12 at a rate of \$1348 per acre.

### Residential Land Benefits

Outlet benefits were applied to residential lands within the watershed of Benton CD 12. The outlet benefit was calculated based on runoff burden to the drainage system and use of the drainage system as an outlet. The viewers have determined the outlet benefits for residential lands at the rate of \$154 per acre. Urban Residential lands are valued at the rate of \$309 per acre.

### Woodlot Benefits

Benefits were applied to woodlot lands within the watershed of Benton CD 12. These lands receive a benefit because the ditch conveys their water burden away from adjacent landowners and adds to the need for system capacity and system maintenance. The viewers have determined the benefit for woodlot lands at the rate of \$139 per acre.

### Industrial Benefits

Outlet benefits were applied to industrial lands within the watershed of Benton CD 12. The outlet benefit was calculated based on runoff burden to the drainage system and use of the drainage system as an outlet. Additional consideration has been given to industrial lands due to their ability to produce goods or services on these lands. The viewers have determined the outlet benefits for Industrial lands at the rate of \$386 per acre.

### Benefit Variables

Based on criteria used to determine the likelihood of future improvements, each sub catchment within the watershed of the public drainage system has been given a grade of its as constructed condition relative to its ability to utilize the public drainage system efficiently. This grading system varies the benefit amount according to aforementioned ability within each sub catchment.

### Non-benefiting Acres

Based on current land use and regulatory restrictions, permanent program restrictions (i.e. RIM or CREP) or other permanent restriction and restoration to pre-settlement landscape conditions or creation of wetland areas, we determined some areas to be non-benefited from the drainage system and restricted from taking future benefit from the drainage system. For example, we determined that lands restored to pre-settlement conditions and permanently restricted from future modification would not drain in any altered manner such that the drainage system would be burdened by the land other than such burden as nature would have provided. Further, for example, nonconverted wetlands that are so restricted from conversion by regulation that conversion is unlikely, were not determined to benefit from the system.

State Lands or Water Area Used for Conservation

The Viewers have evaluated these lands in accordance with, MN § 103E.025 subdivision 3.  
“In determining benefits to the state land or water area in any proceeding to levy assessments or offset benefits against damages, proper consideration must be given to the value of the area for the purpose it is held or used by the state, with other material elements of value.”

At the completion of our examination, we did sum up the total benefits for Benton CD 12. We found that the total benefits are \$464,899.64. Damages for CD 12 are \$25,403.66. (See Exhibit A for tabular report of benefits.)

We recommend that the Benton County Drainage Authority hold a final hearing on the report and confirm the benefits and damages for Benton CD 12.

Dated this January 14<sup>th</sup>, 2022.
